## 1. TEST STANDARDS

The tests were performed according to following standards:

[IEEE 1528-2013 \(2014-06\)](#): Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques

[IEEE Std. C95.3 \(2002\)](#): IEEE Recommended Practice for the Measurement of Potentially Hazardous Electromagnetic Fields – RF and Microwave

[IEEE Std. C95.1 \(1992\)](#): IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz.

[IEC 62209-2 \(2010\)](#): Human exposure to radio frequency fields from hand-held and bodymounted wireless communication devices. Human models, instrumentation, and procedures. Procedure to determine the specific absorption rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)

[KDB 865664D01v01r04 \(Augest 7, 2015\)](#): SAR Measurement Requirements for 100 MHz to 6 GHz

[KDB 865664D02v01r02 \(October 23, 2015\)](#): RF Exposure Compliance Reporting and Documentation Considerations

[KDB 643646 D01 SAR Test for PTT Radios v01r03 \(October 23, 2015\)](#): SAR Test Reduction Considerations for Occupational PTT Radios

[KDB 447498 D01 General RF Exposure Guidance v06 \(October 23, 2015\)](#): Mobile and Portable Devices RF Exposure Procedures and Equipment Authorization Policies

[2015 October TCB Workshop](#): SAR may be scaled if radio is tested at lower power without overheating as invalid SAR results cannot be scaled to compensate for power droop

## **2. SUMMARY**

### **2.1. General Remarks**

Date of receipt of test sample	:	May 06, 2016
Testing commenced on	:	May 16, 2016
Testing concluded on	:	May 21, 2016

### **2.2. Product Description**

EUT Name	:	Digital Two-Way Radio
Model Number	:	SPH6050
Trade Mark	:	Samhoo
EUT function description	:	Please reference user manual of this device
Power supply	:	DC 7.40V from battery
Operation frequency range	:	450 MHz – 520 MHz
Modulation type	:	12.5KHz for FM(Analog), 12.5KHz for 4FSK(Digital)
RF Rated Output power	:	4W/0.5W
Emission type	:	FXW/FXD(Digital)/F3E(Analog)
Antenna Type	:	External
Date of Receipt	:	2016/05/06
Device Type	:	Portable
Sample Type	:	Prototype Unit
Exposure category:	:	Occupational exposure / Controlled environment
Test Frequency:	:	450.0 MHz – 465.5MHz – 481.0MHz – 496.5MHz – 512.0MHz

### **2.3. Summary SAR Results**

Mode	Channel Separation	Frequency (MHz)	Position	FCC	
				Maximum Report SAR Results (W/Kg)	
				100% duty cycle	50% duty cycle
UHF	12.5KHz	469.50	Face-held	3.002	1.501
UHF	12.5KHz	469.50	Body-Worn	7.478	3.739

### **2.4. Equipment under Test**

#### **Power supply system utilised**

Power supply voltage	:	<input type="radio"/>	120V / 60 Hz	<input type="radio"/>	115V / 60Hz
		<input type="radio"/>	12 V DC	<input type="radio"/>	24 V DC
		<input checked="" type="radio"/>	Other (specified in blank below)		

DC 7.40 V

### **2.5. EUT operation mode**

The spatial peak SAR values were assessed for UHF systems. Battery and accessories shall be specified by the manufacturer. The EUT battery must be fully charged and checked periodically during the test to ascertain uniform power output.

The sample enter into 100% duty cycle continuous transmit controlled by software VanDyke SecureCRT v7.2.6 provied by application.

## 2.6. TEST Configuration

### Face-Held Configuration

Face-held Configuration- per FCC KDB447498 page 22: "A test separation distance of 25 mm must be applied for in-front-of the face SAR test exclusion and SAR measurements."

Per FCC KDB643646 Apppendix Head SAR Test Considerations: "Passive body-worn and audio accessories generally do not apply to the head SAR of PTT radios. Head SAR is measured with the front surface of the radio positioned at 2.5cm paralled to a flat phantom. A phantom shell thicjnes of 2mm is required. When the front of the radio has a contour or non-uniform surface with a variation of 1.0cm or more, the average distance of such variations is used to establish the 2.5cm test separartion from the phantom."

### Body-worn Configuration

Body-worn measurements-per FCC KDB447498 page 22 "When body-worn accessory SAR testing is required, the body-worn accessory requirements in section 4.2.2 should be applied. PTT two-way radios that support held-to-ear operating mode must also be tested according to the exposure configurations required for handsets. This generally does not apply to cellphones with PTT options that have already been tested in more conservative configurations in applicable wireless modes for SAR compliance at 100% duty factor."

According to KDB643646 D01 for Body SAR Test Considerations for Body-worn Accessoires: Body SAR is measured with the radio placed in a body-worn accessory, positioned against a flat plantom, representative of the normal operating conditions expected by users and typically with a standard default audio accessory supplied with the radio, may be designed to operate with a subset of the combinations of antennas, batteries and body-worn accessores, when a default audio accessory does not fully support all accessory must be selected to be the default audio accessory for body-worn accessories testing. If an alternative audio accessory cannot be identified, body-worn accessories should be tested without any body accessories should be tested without any audio. In general, all sides of the radio that may be positioned facing the user when using a body-worn accessory must be condisered for SAR compliance.

## 2.7. EUT configuration

**The following peripheral devices and interface cables were connected during the measurement:**

Accessory name	Internal Identification	Model	Description	Remark
Antenna	A1	N/A	External Antenna	performed
Battery	B1	B00237200	Intrinsically Safe Li-ion Battery	performed
Belt clip	BC1	SBC00	Belt Clip	performed
Audio Accessories	AC1	EH0100	C-Earset with on-mic PTT	performed
Audio Accessories	AC2	EA0100	Earpiece with on-mic PTT & transparent acoustic tube	performed
Audio Accessories	AC3	ES0100	Earbud with on-mic PTT	performed
Leather carrying	LA1	SLCB100	Leather carrying	performed

AE ID: is used to identify the test sample in the lab internally.

### **3. TEST ENVIRONMENT**

#### **3.1. Address of the test laboratory**

**Shenzhen Yidajietong Test Technology Co., Ltd.**

3/F., Building 12, Shangsha Innovation & Technology Park, Futian District, Shenzhen, Guangdong, China

#### **3.2. Test Facility**

The test facility is recognized, certified, or accredited by the following organizations:

**CNAS-Lab Code: L7547**

The Testing and Technology Center for SHENZHEN YIDA JIETONG INFORMATION TECHNOLOGY CO., LTD has been assessed and proved to be in compliance with CNAS-CL01 Accreditation Criteria for Testing and Calibration Laboratories (identical to ISO/IEC 17025: 2005 General Requirements) for the Competence of Testing and Calibration Laboratories, Date of Registration: March, 2015. Valid time is until March, 2018.

#### **3.3. Environmental conditions**

During the measurement the environmental conditions were within the listed ranges:

Temperature:	18-25 ° C
Humidity:	40-65 %
Atmospheric pressure:	950-1050mbar

#### **3.4. SAR Limits**

FCC Limit (1g Tissue)

<b>Exposure Limits</b>	<b>SAR (W/kg)</b>	
	(General Population / Uncontrolled Exposure Environment)	(Occupational / Controlled Exposure Environment)
Spatial Average (averaged over the whole body)	0.08	0.4
Spatial Peak (averaged over any 1 g of tissue)	1.60	8.0
Spatial Peak (hands/wrists/feet/ankles averaged over 10 g)	4.0	20.0

Population/Uncontrolled Environments are defined as locations where there is the exposure of individual who have no knowledge or control of their exposure.

Occupational/Controlled Environments are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure (i.e. as a result of employment or occupation).

### 3.5. Equipments Used during the Test

Test Equipment	Manufacturer	Type/Model	Serial Number	Calibration	
				Last Calibration	Calibration Interval
Data Acquisition Electronics DAEx	SPEAG	DAE4	1315	2015/07/22	1
E-field Probe	SPEAG	EX3DV4	3842	2015/08/26	1
System Validation Dipole D450V3	SPEAG	D450V3	1072	2015/11/25	3
Network analyzer	Agilent	8753E	US37390562	2016/03/05	1
Dielectric Probe Kit	Agilent	85070E	US44020288	/	/
Power meter	Agilent	E4417A	GB41292254	2015/12/15	1
Power sensor	Agilent	8481H	MY41095360	2015/12/15	1
Power sensor	Agilent	8481H	MY41095361	2015/12/15	1
Signal generator	IFR	2032	203002/100	2015/10/12	1
Amplifier	AR	75A250	302205	2015/10/12	1

Note:

- 1) Per KDB865664D01 requirements for dipole calibration, the test laboratory has adopted three year extended calibration interval. Each measured dipole is expected to evaluate with following criteria at least on annual interval.
  - a) There is no physical damage on the dipole;
  - b) System check with specific dipole is within 10% of calibrated values;
  - c) The most recent return-loss results, measured at least annually, deviates by no more than 20% from the previous measurement;
  - d) The most recent measurement of the real or imaginary parts of the impedance, measured at least annually is within 50 Ω from the previous measurement.
- 2) Network analyzer probe calibration against air, distilled water and a shorting block performed before measuring liquid parameters.

## **4. SAR Measurements System configuration**

### **4.1. SAR Measurement Set-up**

The DASY5 system for performing compliance tests consists of the following items:

A standard high precision 6-axis robot (Stäubli RX family) with controller and software. An arm extension for accommodating the data acquisition electronics (DAE).

A dosimetric probe, i.e. an isotropic E-field probe optimized and calibrated for usage in tissue simulating liquid. The probe is equipped with an optical surface detector system.

A data acquisition electronic (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.

A unit to operate the optical surface detector which is connected to the EOC.

The Electro-Optical Coupler (EOC) performs the conversion from the optical into a digital electric signal of the DAE. The EOC is connected to the DASY5 measurement server.

The DASY5 measurement server, which performs all real-time data evaluation for field measurements and surface detection, controls robot movements and handles safety operation. A computer operating Windows 2003.

DASY5 software and SEMCAD data evaluation software.

Remote control with teach panel and additional circuitry for robot safety such as warning lamps, etc.

The generic twin phantom enabling the testing of left-hand and right-hand usage.

The device holder for handheld Mobile Phones.

Tissue simulating liquid mixed according to the given recipes.

System validation dipoles allowing to validate the proper functioning of the system.

## 4.2. DASY5 E-field Probe System

The SAR measurements were conducted with the dosimetric probe ES3DV3 (manufactured by SPEAG), designed in the classical triangular configuration and optimized for dosimetric evaluation.

### Probe Specification

Construction	Symmetrical design with triangular core Interleaved sensors Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.g., DGBE)
Calibration	ISO/IEC 17025 calibration service available.
Frequency	10 MHz to 4 GHz; Linearity: $\pm 0.2$ dB (30 MHz to 4 GHz)
Directivity	$\pm 0.2$ dB in HSL (rotation around probe axis) $\pm 0.3$ dB in tissue material (rotation normal to probe axis)
Dynamic Range	5 $\mu$ W/g to > 100 mW/g; Linearity: $\pm 0.2$ dB
Dimensions	Overall length: 337 mm (Tip: 20 mm) Tip diameter: 3.9 mm (Body: 12 mm) Distance from probe tip to dipole centers: 2.0 mm
Application	General dosimetry up to 4 GHz Dosimetry in strong gradient fields Compliance tests of Mobile Phones
Compatibility	DASY3, DASY4, DASY52 SAR and higher, EASY4/MRI

### Isotropic E-Field Probe

The isotropic E-Field probe has been fully calibrated and assessed for isotropicity, and boundary effect within a controlled environment. Depending on the frequency for which the probe is calibrated the method utilized for calibration will change.

The E-Field probe utilizes a triangular sensor arrangement as detailed in the diagram below:

## 4.3. Phantoms

Phantom for compliance testing of handheld andbody-mounted wireless devices in the frequency range of 30 MHz to 6 GHz. ELI is fully compatible with the IEC 62209-2 standard and all known tissuesimulating liquids. ELI has been optimized regarding its performance and can beintegrated into our standard phantom tables. A cover prevents evaporation ofthe liquid. Reference markings on the phantom allow installation of thecomplete setup, including all predefined phantom positions and measurementgrids, by teaching three points. The phantom is compatible with all SPEAGdosimetric probes and dipoles.

ELI Phantom

#### 4.4. Device Holder

The device was placed in the device holder (illustrated below) that is supplied by SPEAG as an integral part of the DASY system.

The DASY device holder is designed to cope with the different positions given in the standard. It has two scales for device rotation (with respect to the body axis) and device inclination (with respect to the line between the ear reference points). The rotation centers for both scales is the ear reference point (ERP). Thus the device needs no repositioning when changing the angles.

Device holder supplied by SPEAG

#### 4.5. Scanning Procedure

The DASY5 installation includes predefined files with recommended procedures for measurements and validation. They are read-only document files and destined as fully defined but unmeasured masks. All test positions (head or body-worn) are tested with the same configuration of test steps differing only in the grid definition for the different test positions.

The “reference” and “drift” measurements are located at the beginning and end of the batch process. They measure the field drift at one single point in the liquid over the complete procedure. The indicated drift is mainly the variation of the DUT’s output power and should vary max.  $\pm 5\%$ .

The “surface check” measurement tests the optical surface detection system of the DASY5 system by repeatedly detecting the surface with the optical and mechanical surface detector and comparing the results. The output gives the detecting heights of both systems, the difference between the two systems and the standard deviation of the detection repeatability. Air bubbles or refraction in the liquid due to separation of the sugar-water mixture gives poor repeatability (above  $\pm 0.1\text{mm}$ ). To prevent wrong results tests are only executed when the liquid is free of air bubbles. The difference between the optical surface detection and the actual surface depends on the probe and is specified with each probe (It does not depend on the surface reflectivity or the probe angle to the surface within  $\pm 30^\circ$ .)

#### Area Scan

The Area Scan is used as a fast scan in two dimensions to find the area of high field values before running a detailed measurement around the hot spot. Before starting the area scan a grid spacing of 15 mm x 15 mm is set. During the scan the distance of the probe to the phantom remains unchanged. After finishing area scan, the field maxima within a range of 2 dB will be ascertained.

#### Zoom Scan

Zoom Scans are used to estimate the peak spatial SAR values within a cubic averaging volume containing 1 g and 10 g of simulated tissue. The default Zoom Scan is done by 7x7x7 points within a cube whose base is centered around the maxima found in the preceding area scan.

#### Spatial Peak Detection

The procedure for spatial peak SAR evaluation has been implemented and can determine values of masses of 1g and 10g, as well as for user-specific masses. The DASY5 system allows evaluations that combine measured data and robot positions, such as:

- maximum search
- extrapolation
- boundary correction
- peak search for averaged SAR

During a maximum search, global and local maxima searches are automatically performed in 2-D after each Area Scan measurement with at least 6 measurement points. It is based on the evaluation of the local SAR gradient calculated by the Quadratic Shepard's method. The algorithm will find the global maximum and all local maxima within -2 dB of the global maxima for all SAR distributions.

Extrapolation routines are used to obtain SAR values between the lowest measurement points and the inner phantom surface. The extrapolation distance is determined by the surface detection distance and the probe sensor offset. Several measurements at different distances are necessary for the extrapolation. Extrapolation routines require at least 10 measurement points in 3-D space. They are used in the Zoom Scan to obtain SAR values between the lowest measurement points and the inner phantom surface. The routine uses the modified Quadratic Shepard's method for extrapolation. For a grid using 7x7x7 measurement points with 5mm resolution amounting to 343 measurement points, the uncertainty of the extrapolation routines is less than 1% for 1g and 10g cubes.

A Z-axis scan measures the total SAR value at the x-and y-position of the maximum SAR value found during the cube 7x7x7 scan. The probe is moved away in z-direction from the bottom of the SAM phantom in 5mm steps.

## 4.6. Data Storage and Evaluation

#### Data Storage

The DASY5 software stores the acquired data from the data acquisition electronics as raw data (in microvolt readings from the probe sensors), together with all necessary software parameters for the data evaluation (probe calibration data, liquid parameters and device frequency and modulation data) in measurement files with the extension “.DA4”. The software evaluates the desired unit and format for output each time the data is visualized or exported. This allows verification of the complete software setup even after the measurement and allows correction of incorrect parameter settings. For example, if a measurement has been performed with a wrong crest factor parameter in the device setup, the parameter can be corrected afterwards and the data can be re-evaluated.

The measured data can be visualized or exported in different units or formats, depending on the selected probe type ([V/m], [A/m], [ $^\circ\text{C}$ ], [mW/g], [mW/cm<sup>2</sup>], [dBrel], etc.). Some of these units are not available in certain situations or show meaningless results, e.g., a SAR output in a lossless media will always be zero. Raw data can also be exported to perform the evaluation with other software packages.

#### Data Evaluation

The SEMCAD software automatically executes the following procedures to calculate the field units from the microvolt readings at the probe connector. The parameters used in the evaluation are stored in the configuration modules of the software:

Probe parameters:  
- Sensitivity  
- Conversion factor

Normi, ai0, ai1, ai2  
ConvFi

Device parameters:	- Diode compression point	Dcp <i>i</i>
	- Frequency	f
	- Crest factor	cf
Media parameters:	- Conductivity	$\sigma$
	- Density	$\rho$

These parameters must be set correctly in the software. They can be found in the component documents or they can be imported into the software from the configuration files issued for the DASY5 components. In the direct measuring mode of the multimeter option, the parameters of the actual system setup are used. In the scan visualization and export modes, the parameters stored in the corresponding document files are used.

The first step of the evaluation is a linearization of the filtered input signal to account for the compression characteristics of the detector diode. The compensation depends on the input signal, the diode type and the DC-transmission factor from the diode to the evaluation electronics. If the exciting field is pulsed, the crest factor of the signal must be known to correctly compensate for peak power. The formula for each channel can be given as:

$$V_i = U_i + U_i^2 \cdot \frac{cf}{dcpi}$$

With  $V_i$  = compensated signal of channel  $i$  ( $i = x, y, z$ )  
 $U_i$  = input signal of channel  $i$  ( $i = x, y, z$ )  
 $cf$  = crest factor of exciting field (DASY parameter)  
 $dcpi$  = diode compression point (DASY parameter)

From the compensated input signals the primary field data for each channel can be evaluated:

$$E - \text{fieldprobes} : \quad E_i = \sqrt{\frac{V_i}{Norm_i \cdot ConvF}}$$

$$H - \text{fieldprobes} : \quad H_i = \sqrt{V_i} \cdot \frac{a_{i0} + a_{i1}f + a_{i2}f^2}{f}$$

With  $V_i$  = compensated signal of channel  $i$  ( $i = x, y, z$ )  
 $Norm_i$  = sensor sensitivity of channel  $i$  ( $i = x, y, z$ )  
 $[mV/(V/m)^2]$  for E-field Probes  
 $ConvF$  = sensitivity enhancement in solution  
 $a_{ij}$  = sensor sensitivity factors for H-field probes  
 $f$  = carrier frequency [GHz]  
 $E_i$  = electric field strength of channel  $i$  in V/m  
 $H_i$  = magnetic field strength of channel  $i$  in A/m

The RSS value of the field components gives the total field strength (Hermitian magnitude):

$$E_{tot} = \sqrt{E_x^2 + E_y^2 + E_z^2}$$

The primary field data are used to calculate the derived field units.

$$SAR = E_{tot}^2 \cdot \frac{\sigma}{\rho \cdot 1'000}$$

with  $SAR$  = local specific absorption rate in mW/g  
 $E_{tot}$  = total field strength in V/m  
 $\sigma$  = conductivity in [mho/m] or [Siemens/m]  
 $\rho$  = equivalent tissue density in g/cm<sup>3</sup>

Note that the density is normally set to 1 (or 1.06), to account for actual brain density rather than the density of the simulation liquid.

## 4.7. SAR Measurement System

The SAR measurement system being used is the DASY5 system, the system is controlled remotely from a PC, which contains the software to control the robot and data acquisition equipment. The software also displays the data obtained from test scans.

In operation, the system first does an area (2D) scan at a fixed depth within the liquid from the inside wall of the phantom. When the maximum SAR point has been found, the system will then carry out a 3D scan centred at that point to determine volume averaged SAR level.

#### 4.7.1 Tissue Dielectric Parameters for Head and Body Phantoms

The liquid is consisted of water,salt,Glycol,Sugar,Preventol and Cellulose.The liquid has previously been proven to be suited for worst-case. It's satisfying the latest tissue dielectric parameters requirements proposed by the KDB865664.

Target Frequency (MHz)	Head		Body	
	$\epsilon_r$	$\sigma$ (S/m)	$\epsilon_r$	$\sigma$ (S/m)
150	52.3	0.76	61.9	0.80
300	45.3	0.87	58.2	0.92
450	43.5	0.87	56.7	0.94
835	41.5	0.90	55.2	0.97
900	41.5	0.97	55.0	1.05
915	41.5	0.98	55.0	1.06
1450	40.5	1.20	54.0	1.30
1610	40.3	1.29	53.8	1.40
1800-2000	40.0	1.40	53.3	1.52
2450	39.2	1.80	52.7	1.95
3000	38.5	2.40	52.0	2.73
5800	35.3	5.27	48.2	6.00

( $\epsilon_r$  = relative permittivity,  $\sigma$  = conductivity and  $\rho = 1000 \text{ kg/m}^3$ )

#### 4.8. Dielectric Performance

Dielectric performance of Head and Body tissue simulating liquid.

Composition of the Head Tissue Equivalent Matter

Mixture %	Frequency (Brain) 450MHz
Water	38.56
Sugar	56.32
Salt	3.95
Preventol	0.10
Cellulose	1.07
Dielectric Parameters Target Value	f=450MHz $\epsilon_r=43.5$ $\sigma=0.87$

Composition of the Body Tissue Equivalent Matter

Mixture %	Frequency (Brain) 450MHz

#### 4.9. System Check

The purpose of the system check is to verify that the system operates within its specifications at the device test frequency.The system check is simple check of repeatability to make sure that the system works correctly at the time of the compliance test;

System check results have to be equal or near the values determined during dipole calibration with the relevant liquids and test system ( $\pm 10\%$ ).

System check is performed regularly on all frequency bands where tests are performed with the DASY5 system.

The output power on dipole port must be calibrated to 24 dBm (250mW) before dipole is connected.

#### Justification for Extended SAR Dipole Calibrations

Referring to KDB 865664D01V01r04, if dipoles are verified in return loss (<-20dB, within 20% of prior calibration), and in impedance (within 5 ohm of prior calibration), the annual calibration is not necessary and the calibration interval can be extended. While calibration intervals not exceed 3 years.

#### 4.10. Measurement Procedures

##### Tests to be performed

In order to determine the highest value of the peak spatial-average SAR of a handset, all device positions, configurations and operational modes shall be tested for each frequency band according to steps 1 to 3 below. A flowchart of the test process is shown in Picture 11

Step 1: The tests described in 11.2 shall be performed at the channel that is closest to the centre of the transmit frequency band ( $f_c$ ) for:

- a) all device positions (cheek and tilt, for both left and right sides of the SAM phantom, as described in Chapter 8),
- b) all configurations for each device position in a), e.g., antenna extended and retracted, and
- c) all operational modes, e.g., analogue and digital, for each device position in a) and configuration in b) in each frequency band.
- d) If more than three frequencies need to be tested according to 11.1 (i.e.,  $N_c > 3$ ), then all frequencies, configurations and modes shall be tested for all of the above test conditions.

Step 2: For the condition providing highest peak spatial-average SAR determined in Step 1, perform all tests described in 11.2 at all other test frequencies, i.e., lowest and highest frequencies. In addition, for all other conditions (device position, configuration and operational mode) where the peak spatial-average SAR value

determined in Step 1 is within 3 dB of the applicable SAR limit, it is recommended that all other test frequencies shall be tested as well.

Step 3: Examine all data to determine the highest value of the peak spatial-average SAR found in Steps 1 to 2.

Picture 11 Block diagram of the tests to be performed

Figure 12a – Tests to be performed

Picture 12 Block diagram of the tests to be performed

### Measurement procedure

- The following procedure shall be performed for each of the test conditions (see Picture 11) described in 11.1:
- Measure the local SAR at a test point within 8 mm or less in the normal direction from the inner surface of the phantom.
  - Measure the two-dimensional SAR distribution within the phantom (area scan procedure). The boundary of the measurement area shall not be closer than 20 mm from the phantom side walls. The distance

Figure 12b – General procedure

between the measurement points should enable the detection of the location of local maximum with an accuracy of better than half the linear dimension of the tissue cube after interpolation. A maximum grip spacing of 20 mm for frequencies below 3 GHz and  $(60/f \text{ [GHz]})$  mm for frequencies of 3GHz and greater is recommended. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and  $\delta \ln(2)/2$  mm for frequencies of 3 GHz and greater, where  $\delta$  is the plane wave skin depth and  $\ln(x)$  is the natural logarithm. The maximum variation of the sensor-phantom surface shall be  $\pm 1$  mm for frequencies below 3 GHz and  $\pm 0.5$  mm for frequencies of 3 GHz and greater. At all measurement points the angle of the probe with respect to the line normal to the surface should be less than  $5^\circ$ . If this cannot be achieved for a measurement distance to the phantom inner surface shorter than the probe diameter, additional measurement distance to the phantom inner surface shorter than the probe diameter, additional

- c) From the scanned SAR distribution, identify the position of the maximum SAR value, in addition identify the positions of any local maxima with SAR values within 2 dB of the maximum value that are not within the zoom-scan volume; additional peaks shall be measured only when the primary peak is within 2 dB of the SAR limit. This is consistent with the 2 dB threshold already stated;
- d) Measure the three-dimensional SAR distribution at the local maxima locations identified in step c);
- e) The horizontal grid step shall be  $(24 / f[\text{GHz}])$  mm or less but not more than 8 mm. The minimum zoom size of 30 mm by 30 mm and 30 mm for frequencies below 3 GHz. For higher frequencies, the minimum zoom size of 22 mm by 22 mm and 22 mm. The grip step in the vertical direction shall be  $(8-f[\text{GHz}])$  mm or less but not more than 5 mm, if uniform spacing is used. If variable spacing is used in the vertical direction, the maximum spacing between the two closest measured points to the phantom shell shall be  $(12 / f[\text{GHz}])$  mm or less but not more than 4 mm, and the spacing between father points shall increase by an incremental factor not exceeding 1.5. When variable spacing is used, extrapolation routines shall be tested with the same spacing as used in measurements. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and  $\delta \ln(2)/2$  mm for frequencies of 3 GHz and greater, where  $\delta$  is the plane wave skin depth and  $\ln(x)$  is the natural logarithm. Separate grids shall be centered on each of the local SAR maxima found in step c). Uncertainties due to field distortion between the media boundary and the dielectric enclosure of the probe should also be minimized, which is achieved is the distance between the phantom surface and physical tip of the probe is larger than probe tip diameter. Other methods may utilize correction procedures for these boundary effects that enable high precision measurements closer than half the probe diameter. For all measurement points, the angle of the probe with respect to the flat phantom surface shall be less than  $5^\circ$ . If this cannot be achieved an additional uncertainty evaluation is needed.
- f) Use post processing( e.g. interpolation and extrapolation ) procedures to determine the local SAR values at the spatial resolution needed for mass averaging.

### **Measurement procedure**

The following procedure shall be performed for each of the test conditions (see Picture 11) described in 11.1:

- g) Measure the local SAR at a test point within 8 mm or less in the normal direction from the inner surface of the phantom.
- h) Measure the two-dimensional SAR distribution within the phantom (area scan procedure). The boundary of the measurement area shall not be closer than 20 mm from the phantom side walls. The distance between the measurement points should enable the detection of the location of local maximum with an accuracy of better than half the linear dimension of the tissue cube after interpolation. A maximum grip spacing of 20 mm for frequencies below 3 GHz and  $(60/f \text{ [GHz]})$  mm for frequencies of 3GHz and greater is recommended. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and  $\delta \ln(2)/2$  mm for frequencies of 3 GHz and greater, where  $\delta$  is the plane wave skin depth and  $\ln(x)$  is the natural logarithm. The maximum variation of the sensor-phantom surface shall be  $\pm 1$  mm for frequencies below 3 GHz and  $\pm 0.5$  mm for frequencies of 3 GHz and greater. At all measurement points the angle of the probe with respect to the line normal to the surface should be less than  $5^\circ$ . If this cannot be achieved for a measurement distance to the phantom inner surface shorter than the probe diameter, additional measurement distance to the phantom inner surface shorter than the probe diameter, additional
- i) From the scanned SAR distribution, identify the position of the maximum SAR value, in addition identify the positions of any local maxima with SAR values within 2 dB of the maximum value that are not within the zoom-scan volume; additional peaks shall be measured only when the primary peak is within 2 dB of the SAR limit. This is consistent with the 2 dB threshold already stated;
- j) Measure the three-dimensional SAR distribution at the local maxima locations identified in step i);
- k) The horizontal grid step shall be  $(24 / f[\text{GHz}])$  mm or less but not more than 8 mm. The minimum zoom size of 30 mm by 30 mm and 30 mm for frequencies below 3 GHz. For higher frequencies, the minimum zoom size of 22 mm by 22 mm and 22 mm. The grip step in the vertical direction shall be  $(8-f[\text{GHz}])$  mm or less but not more than 5 mm, if uniform spacing is used. If variable spacing is used in the vertical direction, the maximum spacing between the two closest measured points to the phantom shell shall be  $(12 / f[\text{GHz}])$  mm or less but not more than 4 mm, and the spacing between father points shall increase by an incremental factor not exceeding 1.5. When variable spacing is used, extrapolation routines shall be

tested with the same spacing as used in measurements. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and  $\delta \ln(2)/2$  mm for frequencies of 3 GHz and greater, where  $\delta$  is the plane wave skin depth and  $\ln(x)$  is the natural logarithm. Separate grids shall be centered on each of the local SAR maxima found in step c). Uncertainties due to field distortion between the media boundary and the dielectric enclosure of the probe should also be minimized, which is achieved if the distance between the phantom surface and physical tip of the probe is larger than probe tip diameter. Other methods may utilize correction procedures for these boundary effects that enable high precision measurements closer than half the probe diameter. For all measurement points, the angle of the probe with respect to the flat phantom surface shall be less than 5°. If this cannot be achieved an additional uncertainty evaluation is needed.

- I) Use post processing( e.g. interpolation and extrapolation ) procedures to determine the local SAR values at the spatial resolution needed for mass averaging.

#### **Power Drift**

To control the output power stability during the SAR test, DASY5 system calculates the power drift by measuring the E-field at the same location at the beginning and at the end of the measurement for each test position. These drift values can be found in Table 2 to Table 6 labeled as: (Power Drift [dB]). This ensures that the power drift during one measurement is within 5%.

## **5. TEST CONDITIONS AND RESULTS**

### **5.1. Conducted Power Results**

According KDB 447498 D01 General RF Exposure Guidance v06 Section 4.1.2) states that "Unless it is specified differently in the published RF exposure KDB procedures, these requirements also apply to test reduction and test exclusion considerations. Time-averaged maximum conducted output power applies to SAR and, as required by § 2.1091(c), time-averaged ERP applies to MPE. When an antenna port is not available on the device to support conducted power measurement, such as FRS and certain Part 15 transmitters with built-in integral antennas, the maximum output power allowed for production units should be used to determine RF exposure test exclusion and compliance."

SAR may be scaled if radio is tested at lower power without overheating as invalid SAR results cannot be scaled to compensate for power droop according to October 2015 TCB Workshop.

**Table 5**

<b>Modulation Type</b>	<b>Channel Separation</b>	<b>Test Channel</b>	<b>Test Frequency</b>	<b>Average Transmitter Power</b>			
				<b>Rated High power level (dBm)</b>	<b>Rated Lower power level (Watts)</b>	<b>(dBm)</b>	<b>(Watts)</b>
Analog/FM	12.5KHz	Ch1	450.0 MHz	36.46	4.43	30.64	1.16
		Ch2	465.5 MHz	36.31	4.28	30.17	1.04
		Ch3	481.0 MHz	36.41	4.38	29.87	0.97
		Ch4	496.5 MHz	36.49	4.46	30.13	1.03
		Ch5	512.0 MHz	36.38	4.35	29.94	0.99
Digital/4FSK	12.5KHz	Ch6	450.0 MHz	35.85	3.85	30.11	1.03
		Ch7	465.5 MHz	35.92	3.91	29.57	0.91
		Ch8	481.0 MHz	35.79	3.79	29.32	0.86
		Ch9	496.5 MHz	35.94	3.93	29.54	0.90
		Ch10	512.0 MHz	35.66	3.68	29.41	0.87

*Note:*

1. As the average power of LMR(Land Mobile Radio) in FM modulation (CW) mode higher than 4FSK mode, LMR SAR tests were performed in CW (FM) mode (100% duty cycle) and 50% duty cycle was applied to PTT configurations in the final results.
2. The high power level and lower power level adjust by software, without any modification for hardware.

### **5.2. Test reduction procedure**

The calculated 1-g and 10-g average SAR results indicated as "Max Calc. SAR1-g" and "Max Calc. SAR10-g" in the data Tables is scaling the measured SAR to account for power levelling variations and power slump.

The adjusted 1-g and 10-g average SAR results indicated as "SAR1-g\_Adju" and "SAR10-g\_Adju" in the data Tables is scaling the measured SAR in lower power to account for the same frequency high power levelling. A Table and graph of output power versus time is provided.

For this device the "Max Calc. 1g-SAR" and "Max Calc.10g-SAR" are scaled using the following formula:

$$\text{Max_Calc} = \text{SAR_Adju} * \text{DC} * (\text{P_max}/\text{P_cond})$$

P\_max = highest power including turn up tolerance (W)

P\_cond\_high = highest power in conduct measured (W)

DC = Transmission mode Duty Cycle in % where applicable 50% duty cycle is applied for PTT operation

SAR\_adju = Adjust 1-g and 10-g Average SAR from measured SAR (W/kg)

$$\text{SAR_Adju} = \text{SAR_meas} * (\text{P_cond_high}/\text{P_cond_low})$$

P\_cond\_high = highest power at high power lev (W)

P\_cond\_low = values of highest power frequency rated low power level (W)

### **5.3. SAR Measurement Results**

#### **5.3.1 LMR Assessment at the Head for 450-512 MHz Band**

Battery B00237200 was selected as the default battery for assessment at the Head and Body because it is only battery (refer to external photos for battery illustration). The default battery was used during conducted

power measurements for all test channels are listed in Table 5. The channel with the highest conducted power will be identified as the default channel per KDB 643646 (SAR Test for PTT Radios). We tested highest power channel in lower power in order to meet power drift refer to according to October 2015 TCB Workshop, we adjusted measured SAR values in lower power to highest power; SAR plots of the highest results are presented in SAR measurement results according to KDB 865664D02;

Table 6

Test Frequency		Mode	P_cond_high (W)	P_cond_low (W)	Carry Accessory	Audio Accessory	Spacing (mm)	SAR_meas. (W/kg)	Power Drift (dB)	Scaling Factor	SAR_adju (W/kg)
Channel	MHz

Ch4	496.5	CW	4.46	1.03			25	0.614	-0.20	4.325	2.656
Ch5	512.0	CW	4.35	0.99							

#### Head SAR Test Considerations Note:

1. Passive body-worn and audio accessories generally do not apply to the head SAR of PTT radios. Head SAR is measured with the front surface of the radio positioned at 2.5 cm parallel to a flat phantom. A phantom shell thickness of 2 mm is required. When the front of the radio has a contour or non-uniform surface with a variation of 1.0 cm or more, the average distance of such variations is used to establish the 2.5 cm test separation from the phantom.
2. Testing antennas with the default battery:
  - A. Start by testing a PTT radio with a standard battery (default battery) that is supplied with the radio to measure the head SAR of each antenna on the highest output power channel, according to the test channels required by the number-of-test-channels formula in KDB Publication 447498 D01 and in the frequency range covered by each antenna within the operating frequency bands of the radio. When multiple standard batteries are supplied with a radio, the battery with the highest capacity is considered the default battery for making head SAR measurements.
    - I) When the head SAR of an antenna tested in A) is:
      - a).  $\leq 3.5 \text{ W/kg}$ , testing of all other required channels is not necessary for that antenna
      - b).  $> 3.5 \text{ W/kg}$  and  $\leq 4.0 \text{ W/kg}$ , testing of the required immediately adjacent channel(s) is not necessary; testing of the other required channels may still be required
      - c).  $> 4.0 \text{ W/kg}$  and  $\leq 6.0 \text{ W/kg}$ , head SAR should be measured for that antenna on the required immediately adjacent channels; testing of the other required channels still needs consideration.
      - d).  $> 6.0 \text{ W/kg}$ , test all required channels for that antenna
      - e). for the remaining channels that cannot be excluded in b) and c), which still require consideration, the 3.5 W/kg exclusion in a) and 4.0 W/kg exclusion in b) may be applied recursively with respect to the highest output power channel among the remaining channels; measure the SAR for the remaining channels that cannot be excluded
      - i) if an immediately adjacent channel measured in c) or a remaining channel measured in e) is  $> 6.0 \text{ W/kg}$ , test all required channels for that antenna.
  - B. When the SAR for all antennas tested using the default battery in 1) are  $\leq 4.0 \text{ W/kg}$ , test additional batteries using the antenna and channel configuration that resulted in the highest SAR among all antennas tested in 1). Testing of additional batteries in combination with the remaining antennas is unnecessary.
    - I) When the SAR measured with an additional battery in B) is  $> 6.0 \text{ W/kg}$ , test that additional battery on the highest SAR channel of each antenna measured in 1)
      - a). if the SAR measured in I) is  $> 6.0 \text{ W/kg}$ , test that additional battery and antenna combination(s) on the required immediately adjacent channels
        - i) if the SAR measured in I) or a) is  $> 7.0 \text{ W/kg}$ , test all required channels for the antenna and battery combination(s).
  - C. When the SAR for at least one of the antennas tested in 1) with the default battery is  $> 4.0 \text{ W/kg}$ :
    - I) An antenna tested in 1) with highest SAR  $\leq 4.0 \text{ W/kg}$  does not need to be tested for additional batteries.

- II) When the highest SAR of an antenna tested in 1) is  $> 4.0 \text{ W/kg}$  and  $\leq 6.0 \text{ W/kg}$ , test additional batteries on the channel that resulted in the highest SAR for that antenna in 1).
- III) When the SAR of an antenna tested in 1) or in 2) C) II) is  $> 6.0 \text{ W/kg}$ , test that battery and antenna combination on the required immediately adjacent channels
  - a) if the SAR measured in III) is  $> 7.0 \text{ W/kg}$ , test that battery and antenna combination on all required channels

### 5.3.2 LMR Assessment at the Body worn for Body with SBC00 and EH0100

DUT assessment with offered antennas, default battery (B00237200) and, default body worn accessory (SBC100), default audio accessory (EH0100) per KDB 643646. The default battery was used during conducted power measurements for all test channels in listed in Table 5. The channel with the highest conducted power will be identified as the default channel per KDB 643646 (SAR Test for PTT Radios). We tested highest power channel in lower power in order to meet power drift refer to according to October 2015 TCB Workshop, we adjusted measured SAR values in lower power to highest power; SAR plots of the highest results are presented in SAR measurement results according to KDB 865664D02;

**Table 7**

Test Frequency		Mode	P_cond_high (W)	P_cond_low (W)	Carry Accessory	Audio Accessory	Spacing (mm)	SAR_meas. (W/kg)	Power Drift (dB)	Scaling Factor	SAR_adju (W/kg)
Channel	MHz

Ch5	512.0		4.35	0.99			0	0.272	-0.09	4.406	1.198

#### Body SAR Test Considerations for Body-worn Accessories Note:

1. Body SAR is measured with the radio placed in a body-worn accessory, positioned against a flat phantom, representative of the normal operating conditions expected by users and typically with a standard default audio accessory supplied with the radio. Since audio accessories, including any default audio accessories supplied with a radio, may be designed to operate with a subset of the combinations of antennas, batteries and body-worn accessories, when a default audio accessory does not fully support all the test configurations required in this section for body-worn accessories testing an alternative audio accessory must be selected to be the default audio accessory for body-worn accessories testing.<sup>9</sup> If an alternative audio accessory cannot be identified, body-worn accessories should be tested without any audio accessory. In general, all sides of the radio that may be positioned facing the user when using a body-worn accessory must be considered for SAR compliance.
2. Testing antennas with the default battery and body-worn accessory:
  - A) Start by testing a PTT radio with the thinnest battery and a standard (default) body-worn accessory that are both supplied with the radio and, if applicable, a default audio accessory, to measure the body SAR of each antenna on the highest output power channel, according to the test channels required by the number-of-test-channels formula in KDB Publication 447498 D01 and in the frequency range covered by each antenna within the operating frequency bands of the radio. When multiple default body-worn accessories are supplied with a radio, the standard body-worn accessory expected to result in the highest SAR based on its construction and exposure conditions is considered the default body-worn accessory for making body-worn SAR measurements.
    - I) When the body SAR of an antenna tested in A) is:
      - a)  $\leq 3.5 \text{ W/kg}$ , testing of all other required channels is not necessary for that antenna
      - b)  $> 3.5 \text{ W/kg}$  and  $\leq 4.0 \text{ W/kg}$ , testing of the required immediately adjacent channel(s) is not necessary; testing of the other required channels may still be required
      - c)  $> 4.0 \text{ W/kg}$  and  $\leq 6.0 \text{ W/kg}$ , body SAR should be measured for that antenna on the required immediately adjacent channels; testing of the other required channels still needs consideration
      - d)  $> 6.0 \text{ W/kg}$ , test all required channels for that antenna
      - e) for the remaining channels that cannot be excluded in b) and c), which still require consideration, the 3.5 W/kg exclusion in a) and 4.0 W/kg exclusion in b) may be applied recursively with respect to the highest output power channel among the remaining channels; measure the SAR of the remaining channels that cannot be excluded
        - i) if an immediately adjacent channel measured in c) or a remaining channel measured in e) is  $> 6.0 \text{ W/kg}$ , test all required channels for that antenna
  - B) For batteries with similar construction, test only the battery that is expected to result in the highest SAR. This is generally determined by the smallest antenna separation distance provided by the
3. Testing antennas and default body-worn accessory with additional batteries:
  - A) For batteries with similar construction, test only the battery that is expected to result in the highest SAR. This is generally determined by the smallest antenna separation distance provided by the

- battery and body-worn accessory, between the radio and the user, with the applicable side(s) of the radio facing the user.*
- B) *Based on the SAR distributions measured in 1), for antennas of the same type and construction operating within the same device frequency band, if the frequency range of an antenna (A) is fully within the frequency range of another antenna (B) and the highest SAR for antenna (A) is either  $\leq 4.0$  W/kg or  $\leq 6.0$  W/kg and it is at least 25% lower than the highest SAR measured for antenna (B) within the device operating frequency band, further body SAR tests for the default body-worn accessory with additional batteries for antenna (A) are not necessary. Justifications for antenna similarities must be clearly explained in the SAR report.*
- C) *When the SAR for all antennas tested using the thinnest battery in 1) is  $\leq 4.0$  W/kg, test additional batteries using the antenna and channel configuration that resulted in the highest SAR among all antennas tested in. Testing of additional batteries in combination with the default body-worn and audio accessory and remaining antennas is unnecessary.*
- I) *When the SAR measured with an additional battery in C) is  $> 6.0$  W/kg, test that additional battery with the default body-worn and audio accessory on the highest SAR channel for each antenna measured in 1)*
- a) *if the SAR measured in I) is  $> 6.0$  W/kg, test that additional battery and antenna combination(s) with the default body-worn and audio accessory on the required immediately adjacent channels*
- i) *if the SAR measured in I) or a) is  $> 7.0$  W/kg, test all required channels for the configuration(s)*
- D) *When the SAR for at least one of the antennas tested in 1) with the thinnest battery using the default body-worn and audio accessory is  $> 4.0$  W/kg:*
- A) *An antenna tested in 1) with highest SAR  $\leq 4.0$  W/kg does not need to be tested for additional batteries.*
- B) *When the highest SAR of an antenna tested in 1) is  $> 4.0$  W/kg and  $\leq 6.0$  W/kg, test additional batteries with the default body-worn and audio accessory on the channel that resulted in the highest SAR for that antenna in 1).*
- C) *When the SAR of an antenna tested in 1) or in 2) D) II) is  $> 6.0$  W/kg, test that battery and antenna combination with the default body-worn and audio accessory on the required immediately adjacent channels*
- a) *if the SAR measured in III) is  $> 7.0$  W/kg, test that battery, antenna, body-worn and audio accessory combination on all required channels*
4. Report the measured body SAR for the default body-worn and audio accessory
5. Repeat the preceding test sequence for additional body-worn accessories by replacing “default body-worn” accessory with each “additional body-worn” accessory. For body-worn accessories with similar construction and operating configurations, test only the body-worn accessory within the group that is expected to result in the highest SAR. This is typically determined by the smallest antenna separation distance provided by the body-worn accessory, between the radio and the user, with the applicable side(s) of the radio facing the user. Similarities in construction and operating configurations for batteries and body-worn accessories must be clearly explained in the SAR report.

### 5.3.3 LMR Assessment at the Body worn for Body with SLCB100 and EH0100

DUT assessment with offered antennas, default battery (B00237200) and, default body worn accessory (SLCB100), default audio accessory (EH0100) per KDB 643646. The default battery was used during conducted power measurements for all test channels in listed in Table 5. The channel with the highest conducted power will be identified as the default channel per KDB 643646 (SAR Test for PTT Radios). We tested highest power channel in lower power in order to meet power drift refer to according to October 2015 TCB Workshop, we adjusted measured SAR values in lower power to highest power; SAR plots of the highest results are presented in SAR measurement results according to KDB 865664D02;

**Table 8**

Test Frequency	Mode	P_cond_high (W)	P_cond_low (W)	Carry Accessory	Audio Accessory	Spacing (mm)	SAR_meas. (W/kg)	Power Drift (dB)	Scaling Factor	SAR_adju (W/kg)
Channel		MHz

*Body SAR Test Considerations for Body-worn Accessories Note:*

*Same as Section 5.3.2*

### 5.3.4 LMR Assessment at the Body worn for Body with Other Audio Accessories

DUT assessment with offered antennas, default battery (B00237200) and, default body worn accessory (SLCB100), per KDB 643646. Assessment of additional audio accessories per "KDB 643646 Body SAR Test Consideration for Audio Accessories without Built-in Antenna" Section 1; The default battery was used during conducted power measurements for all test channels in listed in Table 5. The channel with the highest conducted power will be identified as the default channel per KDB 643646 (SAR Test for PTT Radios). We tested highest power channel in lower power in order to meet power drift refer to according to October 2015 TCB Workshop, we adjusted measured SAR values in lower power to highest power; SAR plots of the highest results among Section 5.3.2 are presented in SAR measurement results according to KDB 865664D02;

**Body SAR Test Considerations for Body-worn Accessories Note:**

1. *Audio accessories with an integral antenna or radiating element must be tested separately from those without any primary radiating element. An audio accessory with a built-in antenna that enables the antenna on a PTT radio to be disconnected from its output while the audio accessory is in use should be tested using the highest capacity default battery. When transmission from the antenna on the PTT radio is disabled while the audio accessory is transmitting using its integral antenna, the normal body-worn accessories for the radio are not expected to influence the SAR of the audio accessory. In addition, special body-worn attachments are generally used for audio accessories with an integral antenna; the audio accessory must be tested according to how it is attached to the user during normal operation. Body SAR is measured with the audio accessory positioned against a flat phantom representative of the normal operating and exposure conditions expected by users. All sides of the audio accessory that may be positioned against the user must be considered for SAR compliance.*
2. *An audio accessory is tested on the highest output power channel, according to the test channels required by the number-of-test-channels formula in KDB Publication 447498 D01 and in the frequency range covered by the antenna on the audio accessory within the operating frequency bands of the radio to measure body SAR.*
  - A) *Based on the SAR distributions measured in 1), for audio accessories of the same type and construction operating within the same device frequency band, if the (antenna) frequency range of an audio accessory (A) is fully within the (antenna) frequency range of another audio accessory (B) and the highest SAR for accessory (A) is either  $\leq 4.0$  W/kg or  $\leq 6.0$  W/kg and it is at least 25% lower than the highest SAR measured for accessory (B) within the device operating frequency band, further body SAR tests are not necessary for audio accessory (A). Justifications for antenna and audio accessory similarities must be clearly explained in the SAR report.*
  - B) *When the body SAR of an audio accessory tested in 1) is:*
    - I)  $\leq 3.5$  W/kg, testing of all other required channels is not necessary for that audio accessory
    - II)  $> 3.5$  W/kg and  $\leq 4.0$  W/kg, testing of the required immediately adjacent channel(s) is not necessary; testing of the other required channels may still be required
    - III)  $> 4.0$  W/kg and  $\leq 6.0$  W/kg, body SAR should be measured for that audio accessory and antenna on the required immediately adjacent channels; testing of the other required channels still needs consideration
    - IV)  $> 7.0$  W/kg, test all required channels for that audio accessory
    - V)  $\leq 7.0$  W/kg, for the remaining channels that cannot be excluded in II) and III), which still require consideration, the 3.5 W/kg exclusion in I) and 4.0 W/kg exclusion II) may be applied recursively with respect to the highest output power channel among the remaining channels that cannot be excluded; measure the SAR for the remaining channels that cannot be excluded
      - a) if an immediately adjacent channel in III) or a remain channel measured in V) is  $> 7.0$  W/kg, test all required channels for that audio accessory

## 5.4. SAR Reporting Results

These are not actual measurement SAR values, measurement SAR values taken from Section 5.3 SAR Measurement Results; we also take Section 5.2 formula to calculate maximum report SAR in 50% duty cycle.

$$\text{Max_Calc} = \text{SAR_Adju} * \text{DC} * (\text{P_max}/\text{P_cond})$$

P\_max = highest power including turn up tolerance (W)

P\_cond\_high = highest power in conduct measured (W)

DC = Transmission mode Duty Cycle in % where applicable 50% duty cycle is applied for PTT operation

SAR\_adju = Adjust 1-g and 10-g Average SAR from measured SAR (W/kg)

### 5.4.1 LMR Assessment at the Head for 450-512 MHz Band

**Table 10**

## 5.5. SAR Measurement Variability

SAR measurement variability must be assessed for each frequency band, which is determined by the SAR probe calibration point and tissue-equivalent medium used for the device measurements. When both head and body tissue-equivalent media are required for SAR measurements in a frequency band, the variability measurement procedures should be applied to the tissue medium with the highest measured SAR, using the highest measured SAR configuration for that tissue-equivalent medium. The following procedures are applied to determine if repeated measurements are required.

- 1) Repeated measurement is not required when the original highest measured SAR is < 0.80 W/kg; steps 2) through 4) do not apply.
- 2) When the original highest measured SAR is ≥ 0.80 W/kg, repeat that measurement once.
- 3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is ≥ 1.45 W/kg (~ 10% from the 1-g SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is ≥ 1.5 W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20.

The same procedures should be adapted for measurements according to extremity and occupational exposure limits by applying a factor of 2.5 for extremity exposure and a factor of 5 for occupational exposure to the corresponding SAR thresholds.

Thus the following procedures are applied to determine if repeated measurements are required for occupational exposure.

- 5) Repeated measurement is not required when the original highest measured SAR is < 4.00 W/kg; steps 6) through 8) do not apply.
- 6) When the original highest measured SAR is ≥ 4.00 W/kg, repeat that measurement once.
- 7) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 6.00 or when the original or repeated measurement is ≥ 7.25 W/kg (~ 10% from the 1-g SAR limit).
- 8) Perform a third repeated measurement only if the original, first or second repeated measurement is ≥ 7.5 W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20.

Frequency (MHz)	Mode	Carry Accessory	Audio Accessory	Test Position	Repeated SAR (yes/no)	Highest SAR1-g_adju (W/kg)	First Repeated	
							SAR 1-g_adju (W/kg)	Largest to Smallest SAR Ratio
496.5	CW	SBC100	EH0100	Body-worn	yes	6.617	6.410	0.97

## 5.7. System Check Results

### System Performance Check at 450 MHz Head TSL

DUT: Dipole450 MHz; Type: D450V2; Serial: 1021

Date/Time: 05/16/2016 8:55:01 AM

Communication System: DuiJiangJi; Frequency: 450 MHz; Duty Cycle: 1:1

Medium parameters used (interpolated):  $f = 450 \text{ MHz}$ ;  $\sigma = 0.89 \text{ S/m}$ ;  $\epsilon_r = 44.1$ ;  $\rho = 1000 \text{ kg/m}^3$

Phantom section: Flat Section

DASY5 Configuration:

Probe: EX3DV4 - SN3842; ConvF(10.24, 10.24, 10.24); Calibrated: 8/26/2015;

Sensor-Surface: 2mm (Mechanical Surface Detection)

Electronics: DAE4 Sn1315; Calibrated: 07/22/2015

Phantom: ELI 4.0; Type: QDOVA001BA;

Measurement SW: DASY52, Version 52.8 (2); SEMCAD X Version 14.6.6 (6824)

**System Performance Check at 450MHz/Area Scan (61x201x1):** Interpolated grid:  $dx=1.500 \text{ mm}$ ,  $dy=1.50 \text{ mm}$

Maximum value of SAR (interpolated) = 1.44 W/kg

**System Performance Check at 450MHz/Zoom Scan (7x7x7)/Cube 0:** Measurement grid:  $dx=5\text{mm}$ ,  $dy=5\text{mm}$ ,  $dz=5\text{mm}$

Reference Value = 41.1 V/m; Power Drift = -0.01 dB

Peak SAR (extrapolated) = 1.70 W/Kg

**SAR(1 g) = 1.13 W/kg; SAR(10 g) = 0.779 W/kg**

Maximum value of SAR (measured) = 1.42 W/kg

0 dB = 1.42 W/Kg = 1.52 dB W/kg

System Performance Check 450MHz Head 250mW

**System Performance Check at 450 MHz Body TSL**

DUT: Dipole450 MHz; Type: D450V2; Serial: 1021

Date/Time: 05/16/2016 11:44:17 AM

Medium parameters used (interpolated):  $f = 450$  MHz;  $\sigma = 0.98$  S/m;  $\epsilon_r = 57.5$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Communication System: DuiJiangJi; Frequency: 450 MHz; Duty Cycle: 1:1

Phantom section: Flat Section

DASY5 Configuration:

Probe: EX3DV4 - SN3842; ConvF(10.28, 10.28, 10.28); Calibrated: 8/26/2015;

Sensor-Surface: 2mm (Mechanical Surface Detection)

Electronics: DAE4 Sn1315; Calibrated: 07/22/2015

Phantom: ELI 4.0; Type: QDOVA001BA;

Measurement SW: DASY52, Version 52.8 (2); SEMCAD X Version 14.6.6 (6824)

**System Performance Check at 450MHz/Area Scan (61x201x1):** Interpolated grid: dx=1.500 mm, dy=1.50 mm

Maximum value of SAR (interpolated) = 1.48 W/kg

**System Performance Check at 450MHz/Zoom Scan (7x7x7)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=5mm

Reference Value = 40.3 V/m; Power Drift = 0.05 dB

Peak SAR (extrapolated) = 1.77 W/kg

**SAR(1 g) = 1.15 W/kg; SAR(10 g) = 0.768 W/kg**

Maximum value of SAR (measured) = 1.49 W/kg

0 dB = 1.49 W/Kg = 1.73 dB W/kg

System Performance Check 450MHz Body 250mW

**System Performance Check at 450 MHz Body TSL**

DUT: Dipole450 MHz; Type: D450V2; Serial: 1021

Date/Time: 05/19/2016 09:03:20 AM

Medium parameters used (interpolated):  $f = 450$  MHz;  $\sigma = 0.98$  S/m;  $\epsilon_r = 58.3$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Communication System: DuiJiangJi; Frequency: 450 MHz; Duty Cycle: 1:1

Phantom section: Flat Section

DASY5 Configuration:

Probe: EX3DV4 - SN3842; ConvF(10.28, 10.28, 10.28); Calibrated: 8/26/2015;

Sensor-Surface: 2mm (Mechanical Surface Detection)

Electronics: DAE4 Sn1315; Calibrated: 07/22/2015

Phantom: ELI 4.0; Type: QDOVA001BA;

Measurement SW: DASY52, Version 52.8 (2); SEMCAD X Version 14.6.6 (6824)

**System Performance Check at 450MHz/Area Scan (61x201x1):** Interpolated grid: dx=1.500 mm, dy=1.50 mm

Maximum value of SAR (interpolated) = 1.52 W/kg

**System Performance Check at 450MHz/Zoom Scan (7x7x7)/Cube 0:** Measurement grid: dx=5mm, dy=5mm, dz=5mm

Reference Value = 40.8 V/m; Power Drift = -0.09 dB

Peak SAR (extrapolated) = 1.79 W/kg

**SAR(1 g) = 1.19 W/kg; SAR(10 g) = 0.781 W/kg**

Maximum value of SAR (measured) = 1.55 W/kg

0 dB = 1.55 W/Kg = 1.90 dB W/kg

System Performance Check 450MHz Body 250mW

## 5.8. SAR Test Graph Results

SAR plots for the highest measured SAR in each exposure configuration, wireless mode and frequency band combination according to FCC KDB 865664 D02

### Face Held for FM Modulation at 12.5KHz Channel Separation, Front towards Phantom 469.5MHz

Communication System: PTT 450; Frequency: 469.5 MHz; Duty Cycle: 1:1

Medium parameters used (interpolated):  $f = 469.0 \text{ MHz}$ ;  $\sigma = 0.89 \text{ S/m}$ ;  $\epsilon_r = 44.3$ ;  $\rho = 1000 \text{ kg/m}^3$

Phantom section: Flat Section

Probe: EX3DV4 - SN3842; ConvF(10.24, 10.24, 10.24); Calibrated: 8/26/2015;

Sensor-Surface: 2mm (Mechanical Surface Detection)

Electronics: DAE4 Sn1315; Calibrated: 07/22/2015

Phantom: ELI 4.0; Type: QDOVA001BA;

## 6. Calibration Certificate

### 6.1. Probe Calibration Certificate

**Calibration Laboratory of**  
**Schmid & Partner**  
**Engineering AG**  
**Zeughausstrasse 43, 8004 Zurich, Switzerland**

**S** Schweizerischer Kalibrierdienst  
**C** Service suisse d'étalonnage  
**S** Servizio svizzero di taratura  
**S** Swiss Calibration Service

Accredited by the Swiss Accreditation Service (SAS)  
The Swiss Accreditation Service is one of the signatories to the EA  
Multilateral Agreement for the recognition of calibration certificates

Accreditation No.: SCS 0108

Client CIQ (Shenzhen)

Certificate No: EX3-3842\_Aug15

#### CALIBRATION CERTIFICATE

Object EX3DV4 - SN:3842

Calibration procedure(s) QA CAL-01.v9, QA CAL-12.v9, QA CAL-23.v5, QA CAL-25.v6  
Calibration procedure for dosimetric E-field probes

Calibration date: August 26, 2015

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).  
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature ( $22 \pm 3$ )°C and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

Primary Standards	ID	Cal Date (Certificate No.)	Scheduled Calibration
Power meter E4419B	GB41293874	01-Apr-15 (No. 217-02128)	Mar-16
Power sensor E4412A	MY41498087	01-Apr-15 (No. 217-02128)	Mar-16
Reference 3 dB Attenuator	SN: S5054 (3c)	01-Apr-15 (No. 217-02129)	Mar-16

#### Glossary:

TSL	tissue simulating liquid
NORMx,y,z	sensitivity in free space
ConvF	sensitivity in TSL / NORMx,y,z
DCP	diode compression point
CF	crest factor (1/duty_cycle) of the RF signal
A, B, C, D	modulation dependent linearization parameters
Polarization $\varphi$	$\varphi$ rotation around probe axis
Polarization $\vartheta$	$\vartheta$ rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., $\vartheta = 0$ is normal to probe axis
Connector Angle	information used in DASY system to align probe sensor X to the robot coordinate system

#### Calibration is Performed According to the Following Standards:

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- b) IEC 62209-1, "Procedure to measure the Specific Absorption Rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)", February 2005
- c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

#### Methods Applied and Interpretation of Parameters:

- *NORMx,y,z*: Assessed for E-field polarization  $\vartheta = 0$  ( $f \leq 900$  MHz in TEM-cell;  $f > 1800$  MHz: R22 waveguide). *NORMx,y,z* are only intermediate values, i.e., the uncertainties of *NORMx,y,z* does not affect the  $E^2$ -field uncertainty inside TSL (see below *ConvF*)
- *NORM(f)x,y,z = NORMx,y,z \* frequency response* (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of *ConvF*
- *DCPx,y,z*: DCP are numerical linearization parameters assessed based on the data of power sweep with CW signal (no uncertainty required). DCP does not depend on frequency nor media.
- *PAR*: PAR is the Peak to Average Ratio that is not calibrated but determined based on the signal characteristics
- *Ax,y,z; Bx,y,z; Cx,y,z; Dx,y,z; VRx,y,z; A, B, C, D* are numerical linearization parameters assessed based on the data of power sweep for specific modulation signal. The parameters do not depend on frequency nor media. VR is the maximum calibration range expressed in RMS voltage across the diode.
- *ConvF and Boundary Effect Parameters*: Assessed in flat phantom using E-field (or Temperature Transfer Standard for  $f \leq 800$  MHz) and inside waveguide using analytical field distributions based on power measurements for  $f > 800$  MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to *NORMx,y,z \* ConvF* whereby the uncertainty corresponds to that given for *ConvF*. A frequency dependent *ConvF* is used in DASY version 4.4 and higher which allows extending the validity from  $\pm 50$  MHz to  $\pm 100$  MHz.
- *Spherical isotropy (3D deviation from isotropy)*: in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- *Sensor Offset*: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.
- *Connector Angle*: The angle is assessed using the information gained by determining the *NORMx* (no uncertainty required).

EX3DV4 – SN:3842

August 26, 2015

# Probe EX3DV4

SN:3842

Manufactured: October 25, 2011  
Calibrated: August 26, 2015

Calibrated for DASY/EASY Systems  
(Note: non-compatible with DASY2 system!)

EX3DV4 - SN:3842

August 26, 2015

## DASY/EASY - Parameters of Probe: EX3DV4 - SN:3842

### Basic Calibration Parameters

	Sensor X	Sensor Y	Sensor Z	Unc (k=2)
Norm ( $\mu\text{V}/(\text{V}/\text{m})^2$ ) <sup>A</sup>	0.34	0.53	0.42	$\pm 10.1 \%$
DCP (mV) <sup>B</sup>	101.6	99.9	99.5	

### Modulation Calibration Parameters

UID	Communication System Name		A dB	B dB/ $\mu\text{V}$	C	D dB	VR mV	Unc <sup>E</sup> (k=2)
0	CW	X	0.0	0.0	1.0	0.00	152.0	$\pm 3.0 \%$
		Y	0.0	0.0	1.0		143.5	
		Z	0.0	0.0	1.0		147.4	

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

<sup>A</sup> The uncertainties of Norm X,Y,Z do not affect the E<sup>2</sup>-field uncertainty inside TSL (see Pages 5 and 6).

<sup>B</sup> Numerical linearization parameter, uncertainty not required.

<sup>E</sup> Uncertainty is determined using the max. deviation from linear response applying rectangular distribution and is expressed for the square of the field value.

EX3DV4 - SN:3842

August 26, 2015

## DASY/EASY - Parameters of Probe: EX3DV4 - SN:3842

Calibration Parameter Determined in Head Tissue Simulating Media

f (MHz) <sup>C</sup>	Relative Permittivity <sup>F</sup>	Conductivity (S/m) <sup>F</sup>	ConvF X	ConvF Y	ConvF Z	Alpha <sup>G</sup>	Depth <sup>G</sup> (mm)	Unc (k=2)
450	43.5	0.94	10.24	10.24	10.24	0.18	1.20	± 13.3 %
750	41.9	0.89	9.45	9.45	9.45	0.34	0.93	± 12.0 %
835	41.5	0.90	9.04	9.04	9.04	0.18	1.60	± 12.0 %
900	41.5	0.97	8.92	8.92	8.92	0.22	1.45	± 12.0 %
1750	40.1	1.37	7.80	7.80	7.80	0.35	0.80	± 12.0 %
1900	40.0	1.40	7.54	7.54	7.54	0.29	0.80	± 12.0 %
2450	39.2	1.80	6.82	6.82	6.82	0.35	0.86	± 12.0 %
2600	39.0	1.96	6.74	6.74	6.74	0.37	0.92	± 12.0 %

<sup>C</sup> Frequency validity above 300 MHz of ± 100 MHz only applies for DASY v4.4 and higher (see Page 2), else it is restricted to ± 50 MHz. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity can be extended to ± 110 MHz.

<sup>F</sup> At frequencies below 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\sigma$ ) can be relaxed to ± 10% if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\sigma$ ) is restricted to ± 5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.

<sup>G</sup> Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

750	55.5	0.96	9.38	9.38	9.38	0.35	1.02	± 12.0 %
835	55.2	0.97	9.18	9.18	9.18	0.27	1.22	± 12.0 %
900	55.0	1.05	9.11	9.11	9.11	0.26	1.17	± 12.0 %
1750	53.4	1.49	7.46	7.46	7.46	0.35	0.80	± 12.0 %
1900	53.3	1.52	7.29	7.29	7.29	0.40	0.86	± 12.0 %
2450	52.7	1.95	6.87	6.87	6.87	0.34	0.80	± 12.0 %
2600	52.5	2.16	6.76	6.76	6.76	0.32	0.80	± 12.0 %

<sup>C</sup> Frequency validity above 300 MHz of ± 100 MHz only applies for DASY v4.4 and higher (see Page 2), else it is restricted to ± 50 MHz. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity can be extended to ± 110 MHz.

<sup>F</sup> At frequencies below 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\alpha$ ) can be relaxed to ± 10% if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\alpha$ ) is restricted to ± 5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.

<sup>G</sup> Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

### CALIBRATION CERTIFICATE

Object: **D450V3 - SN: 1072**

Calibrator procedure: **QA CAL-15.v6**  
 Calibration procedure for dipole validation kits below 700 MHz

Calibrator date: **November 25, 2015**

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).  
 The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility, environment temperature: 22 ± 3°C and humidity < 70%.

Calibration Equipment used (NIST-traceable or equivalent)

Primary Standards	ID #	Cal Date (Certificate No.)	Scheduled Calibration
Power meter E44130	OD41294074	01-Apr-15 (No. 217-02109)	Mar-16

**Glossary:**

TSL	tissue simulating liquid
ConvF	sensitivity in TSL / NORM x,y,z
N/A	not applicable or not measured

**Calibration is Performed According to the Following Standards:**

- a) IEEE Std 1528-2013, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", June 2013
- b) IEC 62209-1, "Procedure to measure the Specific Absorption Rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)", February 2005
- c) IEC 62209-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 30 MHz to 6 GHz)", March 2010
- d) KDB 865664, "SAR Measurement Requirements for 100 MHz to 6 GHz"

**Additional Documentation:**

- e) DASY4/5 System Handbook

**Methods Applied and Interpretation of Parameters:**

- *Measurement Conditions:* Further details are available from the Validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated.
- *Antenna Parameters with TSL:* The dipole is mounted with the spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis.
- *Feed Point Impedance and Return Loss:* These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required.
- *Electrical Delay:* One-way delay between the SMA connector and the antenna feed point. No uncertainty required.
- *SAR measured:* SAR measured at the stated antenna input power.
- *SAR normalized:* SAR as measured, normalized to an input power of 1 W at the antenna connector.
- *SAR for nominal TSL parameters:* The measured TSL parameters are used to calculate the nominal SAR result.

The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

**Measurement Conditions**

DASY system configuration, as far as not given on page 1.

<b>DASY Version</b>	DASYS	V52.8.8
<b>Extrapolation</b>	Advanced Extrapolation	
<b>Phantom</b>	ELI4 Flat Phantom	Shell thickness: 2 ± 0.2 mm
<b>Distance Dipole Center - TSL</b>	15 mm	with Spacer
<b>Zoom Scan Resolution</b>	dx, dy, dz = 5 mm	
<b>Frequency</b>	450 MHz ± 1 MHz	

**Head TSL parameters**

The following parameters and calculations were applied.

	Temperature	Permittivity	Conductivity
<b>Nominal Head TSL parameters</b>	22.0 °C	43.5	0.87 mho/m
<b>Measured Head TSL parameters</b>	(22.0 ± 0.2) °C	44.0 ± 6 %	0.89 mho/m ± 6 %
<b>Head TSL temperature change during test</b>	< 0.5 °C	---	---

**SAR result with Head TSL**

<b>SAR averaged over 1 cm<sup>3</sup> (1 g) of Head TSL</b>	Condition	
SAR measured	250 mW input power	1.10 W/kg
SAR for nominal Head TSL parameters	normalized to 1W	4.57 W/kg ± 18.1 % (k=2)

<b>SAR averaged over 10 cm<sup>3</sup> (10 g) of Head TSL</b>	condition	
SAR measured	250 mW input power	0.770 W/kg
SAR for nominal Head TSL parameters	normalized to 1W	3.07 W/kg ± 17.6 % (k=2)

**Body TSL parameters**

The following parameters and calculations were applied.

	Temperature	Permittivity	Conductivity
<b>Nominal Body TSL parameters</b>	22.0 °C	56.7	0.94 mho/m
<b>Measured Body TSL parameters</b>	(22.0 ± 0.2) °C	56.3 ± 6 %	0.85 mho/m ± 6 %
<b>Body TSL temperature change during test</b>	< 0.5 °C	---	---

**SAR result with Body TSL**

<b>SAR averaged over 1 cm<sup>3</sup> (1 g) of Body TSL</b>	Condition	
SAR measured	250 mW input power	1.13 W/kg
SAR for nominal Body TSL parameters	normalized to 1W	4.48 W/kg ± 18.1 % (k=2)

<b>SAR averaged over 10 cm<sup>3</sup> (10 g) of Body TSL</b>	condition	
SAR measured	250 mW input power	0.744 W/kg
SAR for nominal Body TSL parameters	normalized to 1W	2.95 W/kg ± 17.6 % (k=2)

**Appendix (Additional assessments outside the scope of SCS 0108)****Antenna Parameters with Head TSL**

Impedance, transformed to feed point	57.0 $\Omega$ - 4.4 $j\Omega$
Return Loss	- 22.2 dB

**Antenna Parameters with Body TSL**

Impedance, transformed to feed point	53.6 $\Omega$ - 9.0 $j\Omega$
Return Loss	- 20.8 dB

**General Antenna Parameters and Design**

Electrical Delay (one direction)	1.356 ns
----------------------------------	----------

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.  
No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

**Additional EUT Data**

Manufactured by	SPEAG
Manufactured on	November 25, 2009

**DASY5 Validation Report for Head TSL**

Date: 25.11.2015

Test Laboratory: SPEAG, Zurich, Switzerland

**DUT: Dipole 450 MHz; Type: D450V3; Serial: D450V3 - SN: 1072**

Communication System: UID 0 - CW; Frequency: 450 MHz  
Medium parameters used:  $f = 450$  MHz;  $\sigma = 0.89$  S/m;  $\epsilon_r = 44$ ;  $\rho = 1000$  kg/m $^3$   
Phantom section: Flat Section  
Measurement Standard: DASY5 (IEEE/IEC/ANSI C63.19-2011)

DASY5 Configuration:

**Acceptable Conditions for SAR Measurements Using Probes and Dipoles  
Calibrated under the SPEAG-CTTL Dual-Logo Calibration Program to  
Support FCC Equipment Certification**

The acceptable conditions for SAR measurements using probes, dipoles and DAEs calibrated by CTTL (*China Telecommunication Technology Labs*), under the Dual-Logo Calibration Certificate program and quality assurance (QA) protocols established between SPEAG (*Schmid & Partner Engineering AG, Switzerland*) and CTTL, to support FCC (*U.S. Federal Communications Commission*) equipment certification are defined and described in the following. The conditions in this KDB are valid until December 31, 2015.

- 1) The agreement established between SPEAG and CTTL is only applicable to calibration services performed by CTTL where its clients (companies and divisions of such companies) are headquartered in the Greater China Region, including Taiwan and Hong Kong. CTTL shall inform the FCC of any changes or early termination to the agreement.
- 2) Only a subset of the calibration services specified in the SPEAG-CTTL agreement, while it remains valid, are applicable to SAR measurements performed using such equipment for supporting FCC equipment certification. These are identified in the following.
  - a) Calibration of dosimetric (SAR) probes EX3DVx, ET3DVx and ES3DVx.
    - i) Free-space E-field and H-field probes, including those used for HAC (hearing aid compatibility) evaluation, temperature probes, other probes or equipment not identified in this document, when calibrated by CTTL, are excluded and cannot be used for measurements to support FCC equipment certification.
    - ii) Signal specific and bundled probe calibrations based on PMR (probe modulation response) characteristics or probe sensor model based linearization methods that are not fully described in SAR standards are excluded and cannot be used for measurements to support FCC equipment certification.
  - b) Calibration of SAR system validation dipoles, excluding HAC dipoles.
  - c) Calibration of data acquisition electronics DAE3Vx, DAE4Vx and DAEasyVx.
  - d) For FCC equipment certification purposes, the frequency range of SAR probe and dipole calibrations is limited to 700 MHz - 6 GHz and provided it is supported by the equipment identified in the CTTL QA protocol (a separate attachment to this document).
  - e) The identical system and equipment setup, measurement configurations, hardware, evaluation algorithms, calibration and QA protocols, including the format of calibration certificates and reports used by SPEAG shall be applied by CTTL. Equivalent test equipment and measurement configurations may be considered only when agreed by both SPEAG and the FCC.
  - f) The calibrated items are only applicable to SPEAG DASY 4 and DASY 5 systems or higher version systems that satisfy the requirements of this KDB.
- 3) The SPEAG-CTTL agreement includes specific protocols identified in the following to ensure the quality of calibration services provided by CTTL under this SPEAG-
